## Welcome to Dutch Passion

Dutch Passion was the second European Cannabis Seed Company, established in Amsterdam in 1987. It is our mission to supply the recreational and medical home grower with the highest quality cannabis seeds available in all countries where growing is legally allowed.

After many years of dedication Dutch Passion remains a leading supplier of the world's best cannabis genetics. Our experienced team do their utmost to maintain the quality of our existing varieties and constantly strives to find new ones from an extensive network of worldwide sources.

We supply a few thousands of retailers and seed distributors around the world.

Dutch Passion have never been afraid to upset conventional thinking; we invented feminized seeds in the 1990's and more recently have pioneered the introduction of 10-week Autoflower seeds which have helped make life even easier for the self-sufficient cannabis grower. CBD-rich medical cannabis genetics is a new area that we are proud to be leading.

The foundation of our success is the genetic control we have over our strains and the constant influx of new genetics that we obtain worldwide. The result is a seed collection based on stable classic varieties and exciting new ones. Our seed collection has never been better.

All Dutch Passion varieties have been developed with an ethical approach for nature and the environment.

## Non GMO Statement.

All Cannabis varieties in the Dutch Passion catalogue have been obtained through classic crossing, selective breeding and inbreeding techniques. Dutch Passion does not work with Genetically Modified Organisms (GMO) or GMO techniques and has no plans to change that in future.

On the front cover: Auto Brooklyn Sunrise®  
On the back cover: Power Plant®

## Regular, Feminized and Autoflower

**Regular seeds** will give rise to male and female plants in roughly equal numbers. They are the preferred way of growing for old-school growers who like the traditional approach to cannabis seeds. Regular cannabis seeds are also important for cannabis breeders that like the freedom to select male and female plants for their own breeding projects.

**Feminized seeds.** Dutch Passion were the first company to discover the techniques for making feminized seeds in the 1990's. Today feminized seeds are very stable and account for over 97% of all the seeds bought by our customers. Feminized seeds give rise to nearly all female offspring. A percentage of 95% to 99% can be expected to grow into mature female plants in good conditions. Self sufficient cannabis growers prefer feminized seeds because they enable smaller grow rooms with less plants (less risk) and therefore less energy needed to power the grow room. Feminized seeds do carry the small risk of becoming hermaphrodite cannabis plants which show both male and female flowers, however this tends to affect small numbers of plants and is most likely if grow room conditions are poor.

**Autoflower seeds** are feminized and auto-flowering, which means that they automatically start flowering about 3 to 4 weeks after germination and typically finish around 10 - 11 weeks after germination regardless of the light cycle. Autoflower varieties are usually grown indoors under 20 hours of light and 4 hours of darkness each day from seed to harvest. They have earned a reputation as the easiest and most convenient way to grow your own cannabis, especially for new or less experienced cannabis growers.

## Cannabinoids

The most well known cannabinoids are THC (tetrahydrocannabinol) and CBD (cannabidiol). THC is known for getting consumers high or stoned. CBD does not have a psychoactive effect, but it does influence the effect of THC. Cannabis is CBD-rich when it has a CBD percentage of at least 4% in the dried flowers. Most varieties have a THC percentage between 7% and 20%. CBD-rich cannabis is less psychoactive and more physical than traditional cannabis. The CBD reduces the intensity of the THC effect, but also makes it last longer. Consumers of CBD-rich varieties have reported experiences such as an overwhelming feeling of well-being, improved communication skills, a clear mind and a calm feeling. CBD-rich cannabis is also used to alleviate symptoms of a variety of medical conditions, often it's an alternative to synthetic painkillers. It can be misleading to guess the quality of a variety by simply looking at the THC and/or CBD levels. Many factors and the combined influence of all the various cannabinoids are responsible for the effects of a particular cannabis variety in a process known as 'the entourage effect'. There has never been as much medical research into the properties of cannabinoids as there is today.

## Medical use of cannabis

Cannabis is used by millions of people to help with the symptoms and pain caused by various medical conditions. Dutch Passion recommend that medical cannabis users discuss cannabis with medical professionals who are increasingly aware of the medical benefits. Growing your own medical cannabis is the best way to get maximum quality for minimum cost.

The following information about the use of medical cannabis comes directly from the Office of Medicinal Cannabis, which is a department of the Dutch Ministry of Health, Welfare and Sport:

*"There is sufficient reason to believe that medicinal cannabis can help in cases of:*

- *pain and muscle spasms or cramps associated with multiple sclerosis or spinal cord damage;*
- *nausea, loss of appetite, weight loss and debilitation due to cancer or AIDS;*
- *nausea and vomiting associated with chemotherapy or radiotherapy used in the treatment of cancer, hepatitis C or HIV infection and AIDS;*
- *chronic pain (mainly pain associated with the nervous system, for example that caused by a damaged nerve, phantom pain, facial neuralgia or chronic pain which remains after the recovery from shingles);*
- *Gilles de la Tourette syndrome;*
- *therapy-resistant glaucoma.*

*Patients and doctors have also reported positive effects on a range of other conditions, including Crohn's disease, ulcerative colitis, epilepsy, itching, migraine, rheumatism, rheumatoid arthritis, ADD and brain trauma. These positive effects still need to be confirmed by scientific research. (For more information, go to [www.cannabis-med.org](http://www.cannabis-med.org).)*

*At present, medicinal cannabis does not cure the disorders mentioned above, but it can relieve the symptoms associated with them. It may also enable other medication to be given at a lower dosage, and reduce their side effects. It is up to doctors to determine whether treatment with medicinal cannabis would benefit a patient, given his or her diagnosis and circumstances. In doing so, they are not limited to the list of conditions given above. A doctor will only prescribe medicinal cannabis if the standard treatments and registered medicines are not having the desired effect or are causing too many side effects."*

\*This information has been literally taken from the website of the Office of Medicinal Cannabis, part of the Dutch Ministry of Health, Welfare and Sport: [www.cannabisbureau.nl/english](http://www.cannabisbureau.nl/english)

## How to grow cannabis

Professional tips and advice

Cannabis is easy to grow, all Dutch Passion varieties have been bred to grow under a wide range of conditions and many first time growers get great results from our varieties. Growing experience is not essential to cultivate cannabis, but the following advice may be useful:

### How to Germinate Cannabis Seeds.

This is our preferred germination method. There are many more ways to germinate our seeds, each grower has his own preferred method.

Use a grow room with a stable temperature of 20/25 degrees Celsius and use soil with a pH-value of  $\pm 7.0$ . The soil should not be too dry or too wet.

**Step 1** Place your seed at 5 mm deep in the soil and press lightly, this stimulates even sprouting.

**Step 2** Spray the soil lightly with water. The soil should be a bit wet, not soaked.

**Step 3** Cover your pot with transparent plastic kitchen film to achieve an optimal greenhouse effect.

**Step 4** After 1 to 10 days your seeds will have sprouted, and shown it's first set of leaves. You can now remove the plastic film and continue to take the best possible care of your seedling.

After 1 to 2 weeks the seedlings will be strong enough to transfer them to a larger pot. Although Dutch Passion take maximum care to achieve good germination rates it is impossible to guarantee 100% germination on account of the living nature of the products. Please store your seeds in a refrigerator and be as careful and clean as possible during germination.

### Growing Indoors, Outdoors and in Greenhouses

Cannabis has evolved naturally to grow outdoors but it can easily be grown indoors and in greenhouses.

#### Indoor:

Indoor growers usually have a room, closet or tent which contains a light, carbon filter and an air extraction pump. Temperature can be kept at the desired level (around 20°C-27°C) and the plants can grow without pests in optimum conditions to produce superb quality cannabis.

#### Outdoor:

Outdoor growers don't need any specialist equipment, just a sunny growing spot with good quality soil and proven outdoor cannabis seeds. In good conditions a proven outdoor variety can easily reach 3 metres tall and produce over a Kilogram of buds. Outdoor growers often say that cannabis grown naturally under the sun has the best taste and effects.

#### Greenhouse/polytunnel:

If the climate isn't quite warm enough to grow outdoors then a greenhouse or polytunnel will extend the growing season by protecting your plants from the worst of the weather.

## Geographic Location

Cannabis grows well all over the world. The Dutch Passion cannabis genebank contains varieties from all corners of the planet. In the northern hemisphere outdoor and greenhouse growers have a growing season that lasts from around April to October. In the Southern hemisphere e.g. South America the growing season is generally from September to April. Outdoor growers often germinate their cannabis seeds indoors to protect the delicate seedlings for the first week or two. Once the plants are strong enough to put outside they will often need some slug/snail pellets to keep pests off them and perhaps a protective perimeter of chicken wire to prevent grazing animals eating them.

**Temperatures.** Cannabis plants will tolerate high/low temperatures but deliver best results when they do not experience climatic extremes of very cold/very hot weather - which explains why so many indoor growers get consistently good results.

## Substrates

Dutch Passion cannabis varieties have all been extensively tested to grow well across the full range of different growing substrates. This includes soil, coco fibre, hydroponic, glass-wool and the other alternative grow mediums.

- **Soil/compost.** Most cannabis home-growers tend to prefer soil, you can buy it at any garden centre or specialist supplier and its simple to grow with. Seeds can be planted directly in the soil and will germinate, taking all their nutrients from the soil. Nutrients can be added to the water if needed and soil-grown cannabis plants often have excellent taste and aroma. Many first-time growers get excellent results from the simplicity of a soil-grown crop.
- **Coco fibre.** This is one of the most popular alternative to growing plants in soil since the growth rates in coco fibre are generally faster than compost. Coco fibre has a light, porous texture which promotes rapid root growth and good levels of root aeration. However coco fibre contains no nutrients so these have to be added to the water at the correct pH-level. For some people this can be more complicated than soil, but the compensation is generally better yields and faster growth.
- **Hydroponics.** Many different soil-free (hydroponic) growing systems have evolved. Whilst this can be more technically demanding than growing in soil, the main reasons people grow hydroponically is for the very rapid growth rates and high potential yields. With hydroponics the grower has to carefully control pH-level of his feed solution and understand when to change the nutrient solution. Normally hydro growers have already gained some growing experience and their effort is rewarded with growth rates and yields which are difficult to achieve in either soil or coco fibre.
- **Other grow substrates.** Cannabis is a versatile plant and can grow in many different substrates/mediums than the ones listed above. Many growers get excellent results growing in substrates based on glass fibre, natural wool, clay pebbles and other materials. So long as the roots can grow healthily and access the necessary nutrients then the plant will grow well assuming lighting, air flow and temperatures are good.

## Nutrients.

When cannabis is grown naturally in a large amount of soil it is not necessary to feed the plant with extra nutrients. However, if you grow in small containers of soil then eventually you will need to add nutrients to replace those taken from the soil. And if you grow hydroponically, or grow in a material such as coco fibre then you will also need to add nutrients to the water to allow healthy plant growth. The 3 main components plant nutrients are Nitrogen, Phosphorus and Potassium (usually these 3 compounds are referred to as N, P, and K). There are many good quality suppliers of nutrients on the market.

- **Organic/bio.** Some growers prefer organic nutrients for their cannabis. These nutrients are often derived from materials including molasses and other natural sources and are often used by soil growers. Hydroponic growers can't use traditional organic nutrients because they can cause blockages in pipework and valves.

- **Synthetic nutrients.** These account for the majority of nutrients from the major suppliers. The essential minerals (NPK) are dissolved in water and supplied as a concentrate which is diluted by the grower before use. The diluted feed solution is often measured for PH (acidity or alkalinity) and EC (electrical conductivity or mineral concentration) before being given to the plants.

- **Overfeeding and overwatering.** Probably the two most common mistakes by cannabis growers is the tendency to over-water plants grown in soil and to over-feed cannabis plants grown in any medium. Healthy roots are essential to the overall health and growth of a cannabis plant. By over watering a soil-grown plant the roots do not get sufficient aeration which slows plant growth. And over-feeding any cannabis plant (in soil, coco or hydro) will cause 'nutrient burn' which shows up as scorched brown tips to the leaves. This also slows down plant development and limits the final plant size.

- **Feeding schedules & advice.** Stick to the nutrient manufacturers feeding schedule. If anything remember that it is better to temporarily under-feed a plant than to over-feed it and cause nutrient-burn. Try to use minimum nutrient levels and increase them slowly, backing off when necessary. It is also recommended to use a good quality pH meter and EC meter, and to check their readout accuracy on a regular basis.

SolarSystem 550: [www.crazy-leds.com](http://www.crazy-leds.com)

## Lighting

Cannabis needs intense light to grow. In general, more light gives better results.

Light gives the cannabis plant energy for photosynthesis to grow leaves, roots, branches and buds. More light will produce more cannabis, assuming that there are no other limiting factors in your grow room. However just adding more lights to the grow room can increase temperature to problematic levels and will increase energy costs. Dutch Passion strongly recommends LED grow lights for the best quality indoor grown cannabis since they are the most energy efficient lighting technology with low running costs. LED is also extremely reliable and produces almost no heat.

There are 4 main light options for the home grower

- **LED.** Perfectly tuned light spectrum, very low heat, excellent reliability of 50,000++ operating hours. Small and compact, often noise-free. Low running costs. The low heat levels help the buds to retain more of the taste and aroma.

- **HPS.** Low purchase cost comes at the price of high running costs. HPS produces lots of heat and regular bulb replacements are required.

- **Fluorescent.** Fluorescent. Good for seedlings, but less popular for growing large plants. Delicate and easily broken, especially the larger CFL units.

- **Sunlight.** The most eco-friendly way to grow, full spectrum and free. For many organic growers this is the best and only way to grow.

In previous years HPS was the most popular choice for indoor cannabis growing due to the low initial investment to get started. However with rising energy costs, LED offers significantly lower running costs than HPS. For many indoor growers LED is simply the most modern, most efficient and most reliable grow light technology with almost zero heat emission.

## New Dutch Passion Packaging

Dutch Passion seeds are supplied in metal cases which are just 7mm thick. They measure 90mm x 87mm and weigh 43g. They are strong enough to protect the seeds from accidental damage. Inside the tin is a rip-resistant plasticised paper seed pack, this is very difficult to tear open, scissors are the best way to open it. The polymer/paper inner seed packet protects the seeds from external moisture, this allows the seeds to retain the optimised moisture levels set by Dutch Passion when the seeds were packed. The following pack sizes are available

- 7 x Autoflower seeds (Purple)
- 3 x Autoflower seeds (Pink)
- 10 x Regular seeds (Black)
- 10 x Feminized photoperiod seeds (Gold)
- 5 x Feminized photoperiod seeds (Orange)
- 3 x Feminized photoperiod seeds (Green)
- Mix seed packs (Blue)
- Special Editions (Silver)

**NEW!**

# Dutch Outdoor

Top quality outdoor cannabis genetics

The quality and toughness of our outdoor cannabis varieties is the result of decades of experience. All our outdoor varieties are carefully selected, developed and bred in Holland. Dutch Passion outdoor varieties are strong, very productive, mold and disease resistant and will perform well in cold Northern European climates. The varieties will grow well in greenhouses but not indoors unless specifically stated. Yields depend on climate, the amount of sunlight, environmental factors, the date of sowing and nutrition. Harvest times quoted are for the Dutch climate and latitude. Greenhouses fitted with "darkening" blinds can accelerate finishing times. Multiple harvests per year are possible and easy with Autoflower varieties.

## Durban Poison®

Fem / Reg

Dutch Passion original Durban Poison® is a classic outdoor and indoor variety, tough enough for outdoor growing in extreme Northern/Southern latitudes. She was brought to Holland from South Africa and was inbred over many years during the 70's. With each generation Durban Poison® became increasingly adapted to the windy and rainy conditions of Northern Europe. During the breeding process some unknown indica genetics have been crossed with Durban. Durban may initially show wide indica style leaves but the growth pattern allows the sativa dominance to show by the end with long blooms pierced by slim sativa-style leaves. Durban Poison® is ready to harvest after 8-9 weeks indoors. Outdoors she can reach 2-3 metres tall and is harvested around the start of Autumn. With enough root space Durban develops strong side branches which will carry heavy resinous blooms. The plant development, harvest appearance and energising, uplifting high are typically sativa. Durban Poison® has a spicy, hazy taste with hints of aniseed, liquorice and cloves. The buds are often dark green and resistant to mold and pests. Very potent and consistent with good yields.

## Auto Durban Poison®

Autoflower

Auto Durban Poison® is the automatic version of our legendary original Durban Poison photoperiod variety. This Sativa dominant autoflower can be harvested 10-11 weeks after germination and she will grow fast and tall, with plenty of side growth, just like the original. Auto Durban Poison® also shares the same luxuriously pleasant and uplifting experience as the original. This is a top quality feminized automatic which delivers a connoisseur quality vape/smoking experience with good yields. Auto Durban Poison® tends to take longer during vegetative growth than other autoflowers, which can allow her to grow a little taller. The buds grow large and resinous with that special, celebrated, Durban aroma. This variety will perform well outdoors too, she is a high-performance new automatic using some of our best genetics. Ideal for anyone seeking a top quality auto which delivers a strong and refreshing feel-good experience.

Seed to harvest is 10-11weeks, heights are typically 80-100cm, and occasionally she can get taller. Yields for the average grower are 75-100g, depending on the location and growing conditions. Experienced auto growers will easily exceed 100g+ per plant.

XL

Autoflower

€ 3X €31 / 7X €65

## Frisian Dew®

Fem

Frisian Dew® is the most beautiful outdoor variety we have ever encountered. It is a cross between Super Skunk female x Purple Star male that took three years of selection from clones. We produced many Skunk/Purple hybrids in the past 20 years, but we have never seen anything as good as this hybrid. Light purple colour (50% Indica, 50% Sativa) – very high yielder, very good stem to leaf ratio (only little leaves). Not susceptible to mold. Absolute premium quality outdoor strain. A must for the outdoor grower, especially in the Northern Climates. Soft aroma and taste, above medium high. Very commercial. Frisian Dew®: 1st prize Outdoor, High Life Holland 2008.

## Auto Frisian Dew®

Autoflower

Auto Frisian Dew® has been upgraded and improved, it is now based on a specially selected Purple phenotype of our photoperiod Frisian Dew. Several generations of careful selection then followed before we felt happy with the improvements to Auto Frisian Dew®. The plants tend to have rich purple colourations on the blooms, though the leaves stay green. Mold resistance is improved, so is taste. Plants typically reach 60-80cm tall and are often ready 10 weeks after germination, sometimes in under 10 weeks. In cooler outdoor conditions the plant can require an extra week or two. This variety is a little faster than our normal automatics and this helps maximise mold resistance in demanding outdoor conditions. Auto Frisian Dew® performs well indoors, in a greenhouse or outdoors in a sunny, warm spot. Typical yields are 50-60g per plant, but with the right conditions yields of 100g+ are quite possible. Auto Frisian Dew®, with the deep rich purple hues is one of our most attractive Autoflowers, and also delivers good quantities of strong, relaxing pot.

## Forest Dream®

Fem

Forest Dream® is suited for outdoor, greenhouse and indoor growing. This sativa-dominant variety is very easy to grow and therefore suited for less experienced growers. She grows fast, develops lots of side branches and generates heavy yields. She also flowers fast with heavy THC-production, at the end of the flower period the buds are covered in THC crystals. The average plant size is 1.5 to 2 meters but outdoor some grow up to 3-4 meters tall.

The sweet taste is extremely smooth and enjoyable. It's uncommon that all members of the DP smokers test team love the quality, the taste, the high and therefore Forest Dream® is rated as top quality cannabis. The Sativa high is uplifting, quite subtle and with a clear mind so that you're able to stay active. Forest Dream® produces dense buds and the average flower period is only 8 weeks. Grown outdoors Forest Dream® can become sensitive to mold at the end of the flower period so it's advised to frequently check your plants during autumn. If you're looking for an easy to grow outdoor sativa with great yields and energetic high than Forest Dream® is the one for you!

Frisian Duck®

## Frisian Duck®

Fem

Frisian Duck® grows with unusually shaped leaves making it difficult to identify as traditional cannabis and ideal for outdoor and greenhouse growing in populated areas. The name refers to the distinctive leaf shape which looks like a ducks footprint especially during the first two thirds of her life. During bloom some upper leaves may show the more traditional cannabis shape. Frisian Duck® comes from crossing Frisian Dew® with DucksFoot. This unique, robust, stealthy variety is ready to harvest at the start of October (start of April in Southern Hemisphere). She can show beautiful purple colours during flowering and grows like a christmas tree, outdoors up to 2.5 meters, indoors up to 1.5 meters.

Frisian Duck® produces compact buds with spicy aromas of pine, citrus and fresh forest. She was created for outdoor growing but also does well indoors. Frisian Duck® is a unique cannabis plant in disguise; tough and easy to grow, perfect for less experienced growers. Frisian Duck® grows without being recognisable as cannabis for large parts of its life. Anyone that has a quiet sunny corner in their garden, greenhouse or the countryside will now find it easier than ever to grow their own cannabis.

Indica / Sativa

## Auto Duck®

Autoflower

Auto Duck® is a stealth cannabis variety with unusually shaped cannabis leaves which make it difficult to identify as cannabis, especially during the first half of its life before the buds form. Outdoors this variety tends to take around 85-90 days from seed to harvest, she produces good quality cannabis and will bloom well in good conditions outdoors or in a greenhouse. Indoors, she is ready after about 75 days of 20/4 light. AutoDuck® has a stabilized natural leaf deformity, with webbed leaves that resemble a ducks foot print as well as a light odour during bloom.

Auto Duck® is the autoflowering version of the best selling photoperiod 'Frisian Duck®' variety and crossed with our Auto White Widow which turned it into a high potency autoflowering strain. Auto Duck® has green buds and a light cannabis scent compared to Frisian Duck®. Perfect for urban growing, ideal for growers that don't want the world to know they're growing cannabis.

## Passion#1®

Fem / Reg

Passion#1® is one of the best green outdoor varieties available and has been ever since the 1970's when it first appeared as a legendary Californian Indica. Yields can range from 250 grams for typical 2.5 m tall plants to as much as 750g from large plants that can reach staggering proportions (up to 3.5m) when started early in optimum conditions. Passion#1® grows long and compact buds that are heavy with resin, this is a variety developed only for outdoor/greenhouse and is famously easy to grow. Initially, the smoke is soft with a fresh citrus aroma, then Passion #1 hits you fast with a strong exhilarating 'up' high. Smoke a little more and you will notice a strong, heavy and pleasurable stone. We have measured Passion #1 with THC levels approaching 20%, this is a variety you will want to grow again and again...

## Purple#1®

Fem / Reg

Purple#1® is the world famous original purple strain from the 1980's and has been treasured for its uniquely beautiful colourings and great high. Our original Purple#1® plant is a 50/50 sativa/indica mix. The indica comes from a special purple Afghani which was carefully crossed to create a strong outdoor plant that is fully adapted to the Dutch climate. Yields are a reasonable 250-350 grams per plant. Purple#1® is typically 1.5m-2.5m tall, it is for outdoors/greenhouse only and finishes early. The fan leaves are often sativa-like in appearance and show amazing purple colours. Purple#1® gives a sticky, purple-streaked ganja that has a superb fast-hitting high. It is more of an 'up' high than a heavy stone with a somewhat rough, yet subtle, aroma. A great choice for those seeking a fast-finishing tough outdoor variety that combines uniquely beautiful purple buds with a fresh and potent high.

## Shaman®

Fem / Reg

A proven variety dating back to the 1980's, Shaman® is a reliable, robust and highly potent F1 hybrid of an exceptional male Purple#1 and a top female Skunk. Bred for the outdoor/greenhouse grower, Shaman® is resistant to mould and bud rot. Shaman® is a distinctive, elegant plant growing with clear Sativa characteristics such as long intermodal distance between the large buds. Around half the plants turn a beautiful shade of purple during flowering which is complete by the end of September or early October outdoors. In a greenhouse, flowering takes 7-8 weeks. Shaman® shows great hybrid vigour and delivers a smooth, woody sweet purple smoke that is a sensual high-quality sativa 'up' high. Shaman® is the perfect choice for the outdoor/greenhouse grower looking for robust, quality genetics that have stood the test of time and will deliver bumper harvests.

## Hollands Hope®

**Fem / Reg**

Hollands Hope® is a time honoured outdoor strain, one of the very first to be fully acclimatised and grown outdoors in Holland since the early 1980's. Hollands Hope® is noted for its mold resistance, this is a hardy and reliable variety that is ready for harvest around the end of September or early October after around 8 weeks of flowering.

This is a quality indica bred to tolerate the Dutch outdoor climate but it will grow well in other outdoor climates. The plants are typically 1-2m tall, this is a heavy yielding Indica strain with a real knockout stone and has been a favourite outdoor strain of ours since the beginning.

Plants can yield anywhere from 100g to 1000g per plant depending on the growing conditions. Be careful not to give too much nutrition to Hollands Hope® as it can encourage too many leaves and actually reduce bud production. Buds typically reach 50cm in length and contain small leaves.

Hollands Hope® has been a reliable and productive outdoor strain for many years, the smoke is quite sweet and the effect is a heavy, sit-down smoke that will be appreciated by recreational smokers and medical users alike.

## Twilight®

**Fem**

Twilight® is one of Dutch Passions proven outdoor strains that growers have been loyal to for a combination of beautiful purple blooms, a genuine stony indica high and reliable growth. Twilight® is a quite exceptionally beautiful purple variety, 100% indica with heavy yields and buds that can be 50cm long when grown well. She is often sown outdoors after 15th May and is harvested at the end of September or in the 1st week in October after 7-8 weeks of flowering. Plants grow to 1-1.5m tall and have good yields. During autumn they undertake a beautiful purple transformation that you will want to sit and gaze at; these are quite special and handsome plants.

The taste is earthy with a strong and sour Afghani flavour. The high is strong and skunky. It is a long lasting high that will normally be elevating but may also cause you to sit back and relax, and then sit back again.

Many of the repeat-growers of Twilight® are medical users who say that this is particularly effective for arthritis or chronic pain. Recreational users of Twilight® only recommend smoking this in the evening; otherwise it will wipe out the whole day!

## StarRyder®

**Autoflower**

StarRyder® is the product of a very successful project between Dutch Passion and the Joint Doctor. The collaboration took a few years to create this outstanding autoflower variety. An exceptional Dutch Passion Isis clone, a premium sativa with a first class "high", was carefully hybridised by Joint Doctor with one of his best indica dominant automatics. The result is a very potent autoflower variety. The first part of the name refers to the outstanding quality and performance, a real Star. The second part of the name refers to the Joint Doctor, the autoflowering pioneer and producer of the original LowRyder. StarRyder® grows like a compact Christmas tree, producing large resinous buds, growing to around 50cm tall and yielding 45 to 100 grams to the average grower. Experienced autoflower growers can yield over 100 grams per plant growing in soil or coco. Yields of over 200 grams per plant are possible with hydro methods such as DWC (Deep Water Culture) in the hands of the very best growers who will be able to grow plants around 1m tall. The THC content is around 15 to 19% which is special for an autoflower variety. The "high" is described as powerful and fast hitting. The taste is smooth and sweet.

# High Altitude

Mountain cannabis, developed in the Swiss Alps.

Most modern cannabis seed varieties are selectively bred at low altitude and grown at low altitude. When we looked at the offerings from other seed companies we couldn't find any good quality high-altitude varieties. To fill the demand Dutch Passion developed two high-altitude varieties, Pamir Gold® and SnowBud®. These were created in the Swiss Alps over many generations of selective breeding during the 1990's. Today Pamir Gold® and SnowBud® are recognised as two of the best varieties for high altitude growing in any mountainous region such as the Alps, Pyrenees, Sierra Nevada and Caucasus.

## Pamir Gold®

Fem

Pamir Gold® originated in the western Himalayas of Tadjikistan. The plant was adapted to the high altitudes of the Swiss Alps during several years of selective breeding. Once selected seeds were reproduced in the Netherlands. Pamir Gold® is a mostly indica variety (60%,40%) having a sweet earthy taste with a breath of lemon and pear. Healthy plants are 1.5 to 1.8 meters in height outdoors. Mold and mildew resistant. Yield: above average. Does also well indoors. Subtile stone/high.

## SnowBud®

Fem

SnowBud® is our second "High Altitude" variety. SnowBud® is a hybrid of Afghani and South African genetics. As with Pamir Gold® the selection work is done in the Swiss Alps. SnowBud® (60% Sat./ 40% Ind.) has a spicy (cinnamon), skunky smell and taste, smokes very smooth and has a medium "up high". Healthy plants may reach 1.8 till 2.2 meters outdoors. Mold and mildew resistant. Yield: above average. Does also well indoors. The name SnowBud® refers to the huge amount of white pistils in the female flowers (buds).

# CBD Rich

Rich in CBD for both medical and recreational growers.

CBD-rich cannabis contains 4% or more CBD (Cannabidiol) in the dried buds, 10 or 20 times the quantity found in normal cannabis varieties. CBD-rich varieties are one of the newest innovations in cannabis breeding. Dutch Passion have been proud to help pioneer this work. CBD-rich cannabis is popular with medical cannabis growers who value the properties and physical effects of CBD. CBD-rich cannabis has a strong body effect making it good for pain relief but for many people CBD is not excessively psychoactive, allowing people to enjoy cannabis medication yet still function well in their normal daily routine.

## CBD Kush®

Fem

A variety produced in cooperation with the CBD Crew. CBD Kush® is a CBD-rich variety with an approximate 1:1 ratio of THC:CBD. Tests have shown that CBD levels of up to 8% have been measured with a similar quantity of THC. This variety was produced by crossing a THC rich Kandy Kush selection with a CBD dominant strain. The variety has a mix of indica and sativa genetics but the growth pattern generally shows an indica dominant appearance with good yields and a satisfying flavour. Plants generally reach around 100cm tall.

This is a variety which will appeal to medical users looking for a CBD strain, but we also expect some recreational growers will be attracted to the strong body stone and the pleasurable and manageable high.

## CBD Skunk Haze®

Fem

CBD Skunk Haze® comes from a project between Dutch Passion and CBD Crew. The goal was to achieve an optimum ratio of 1:1 THC:CBD. For medical use low %THC is preferred for some medical patients who want a relaxing and high quality genuine cannabis effect without the intensity that some high THC varieties give. Recreational users find that high CBD levels give a very comfortable and smooth high without anxiety or paranoia. CBD Skunk Haze® contains 7,5% THC and 7,5% CBD. To create this variety our Haze/Skunk (winner of the 1992 High Times Cannabis Cup) was carefully crossed with a high CBD variety.

CBD Skunk Haze® produces large tall plants. This Sativa/Indica cross (50/50) produces large buds which are not too dense. The aroma and taste are of spicy cedar wood alongside tones of citrus, pine and mint. CBD Skunk Haze® grows well Indoors and in a greenhouse. The flowering period is approximately 10 weeks and yields up to 450 grams/m<sup>2</sup> are possible under ideal conditions.

### CBD Auto Compassion Lime®

Autoflower

This CBD-rich feminized auto variety uses genetics from the photoperiod CBD Compassion® and our Californian Orange® X USA Sour Diesel crossing, known as Daiquiri Lime. CBD levels are around 9-10% and THC is around 8-9%. The combined effects of high CBD and medium-THC levels create a good medical variety with strong body effects and reduced psycho-activity compared to typical THC-rich Dutch Passion auto varieties. The variety has a great taste, with citrus lime flavours and a zesty aroma. CBD Auto Compassion Lime® may be ready to harvest just 10-11 weeks after germination, she likes 20 hours of daily light from seed to harvest and has abundant yields.

### CBD Auto White Widow®

Autoflower

CBD Auto White Widow® uses the original Dutch Passion Auto White Widow® crossed with CBD Sweet and Sour Widow by The CBD Crew to create a 1:1 THC:CBD variety. CBD and THC levels can both exceed 9% or 10% in good growing conditions, this is the strongest 1:1 auto we have yet seen and may be useful for medical growers looking for the CBD-rich variety which is easy to grow and delivers stronger than average medical effects. Its easy to grow under 20 hours of daily light, and can be harvested around 9-10 weeks after germination with yields that are above average. Powerful medical relief.

# Classics

Heavy yields and exceptional results.

Dutch Passion are proud to present our collection of legendary cannabis seed varieties. Dutch Passion's classic varieties includes Power Plant, White Widow, Outlaw Amnesia (a top quality Amnesia) and many other exceptional strains which are often found in Dutch Coffeeshops. Our classic varieties are praised for quality, taste, stability and effect. All classic varieties are very potent, consistent and heavy yielding, therefore ideal for commercial growers. The Dutch Passion collection of classic indoor varieties has never been as good as it is today. We offer a diverse range of Autoflower and traditional photoperiod genetics.

## Think Big®

Autoflower

Think Big® is a new high performance autoflower based on the legendary Think Different genetics. Think Big® was created after a small number of special XXL Think Different plants were selected from hundreds of plants grown from seed and used as the genetic basis for Think Big®.

Think Big® can grow taller and bigger than Think Different autoflower and takes a couple of weeks longer to finish. The two to three extra weeks that Think Big® needs to finish are responsible for the amazing big yields she offers when treated with love. Resin coverage is often sensational, the cannabis is strong and numbing with a soaring sativa high. The taste has hints of citrus, lemon and incense. Harvest time is typically 13-14 weeks after germination and yields both indoors and outdoors have XXL potential. Exceptional autoflowering genetics have just been pushed to the next level!

Sativa Dominant

## Think Fast®

Fem

Dutch Passion are proud to present the non-autoflowering version of the legendary Think Different. Think Fast® was created by crossing Think Different Autoflower with a specially selected cutting of the Dutch Passion classic Power Plant® in the search of new Autoflower genetics. The first generation offspring, which is normally used for further breeding, was let flowering and gave surprisingly good results. When crossing an autoflowering variety with a traditional photoperiod variety, none of this offspring will be autoflowering. The Dutch Passion geneticists discovered that these non autoflowering plants, which carry the recessive autoflowering gene are significantly faster than their photoperiod parents.

Think Fast® still needs a 12/12 light system to start flowering, but grows bigger and taller in a faster way. With this feature it becomes possible to grow big, potent, photoperiod strains with almost the speed of an Autoflower. Think Fast® can be grown outdoors and indoors and will reach the height of a photoperiod strain, but will be ready to harvest a few weeks earlier. Think Fast® inherited the overwhelming big yields from our classic strain Power Plant and is almost as fast and easy to grow as the legend Think Different.

## Think Different

Autoflower

Think Different is the real surprise package in the Dutch Passion autoflower collection. She has quickly established a great reputation for stunning yields and very strong weed. Even first time growers have achieved over 100g/plant and experienced growers can achieve 200g-300g+. She can grow over 1m tall in experienced hands and is a good alternative to traditional varieties, offering bumper harvests of strong cannabis just 10-11 weeks after seed germination. The genetics come from a special AK47 hybrid known as AK420.

Indoors she has the potential to yield up to 500g/m<sup>2</sup> especially in 'scrog' systems with powerful lights. She joined our list of best sellers just one year after she was released and has created a following of autoflower growers who refuse to grow anything else. Serious growers like you should try growing this at least once!

## Outlaw® (Amnesia)

Fem

Do you become an Outlaw for growing and enjoying marijuana? Dutch Passion don't think so, which is why we are pleased to present Outlaw®, a top quality old-school Haze dominant Sativa that will appeal to both beginners and connoisseur growers alike. With the rock-bottom prices we charge for Outlaw® seeds this variety became a best seller.

We carefully selected original Haze seeds from our 30 year old seedbank to create this variety. She is 80/20 sativa/indica with 15%-20% THC and is a cross of our Super Haze with a very special clone of Amnesia. The high is powerful and fast with a clear uplifting sativa high and a strong Haze accent. The taste is fresh, sour, strong and old-school Hazy. Outlaw® will stretch more than most, perhaps 50cm after switching to flower, and grows well with the SCROG method.

Although she can be harvested as early as 9 weeks, a full 12 week flower period may be required for best taste, yield and high. She grows well in all grow mediums with perhaps the best yields in hydro where yields of up to 500g/m<sup>2</sup> are possible, classifying this as a high production variety.

## Auto Xtreme®

Autoflower

Auto Xtreme® is the exceptional result of a 2 year collaboration between Dutch Passion and DinaFem using some special Haze genetics from Dutch Passion. The project took a lot a careful growing and selection before we were prepared to approve it. The genetics are based on our Outlaw Amnesia® (Amnesia x Super Haze) photoperiod variety and have been adapted into an autoflower which delivers a powerful sativa Haze influence alongside very generous yields. This variety is exclusively available from Dutch Passion.

Auto Xtreme® is harvested around 80 days after germination. This is a little longer than other autoflowers, but with this variety the extra time was needed to give the best combination of potency, taste and crop size. As a result the plants may be a little larger than usual, up to 1.5m tall. This is a new autoflower and one which will be very hard to beat.

## White Widow

Fem / Reg

White Widow is a classic, a winner of countless awards with a reputation as one of the most powerful strains ever created. Our geneticists have worked intensively on this potent and vigorous strain to optimize and then stabilize the best features. The result is a legendary and highly desirable variety that is covered with crystals and delivers generous levels of excellent quality bud. The Dutch Passion White Widow strain is extremely consistent and easy to grow with any grow method. The quality and consistency is particularly pronounced in our feminized version which has become a best-seller and a standard that other seed companies strive to match. Dutch Passions White Widow was perfected many years before most of today's seed companies were even established. That's why many true White Widow aficionados don't mind paying that little bit extra to get genuine 1980's F1 White Widow genetics, with the authentic smell, taste and unmistakably extreme high. Today many commercial seed companies offer White Widow seeds but many of these are distant imitations of the original.

## Auto White Widow®

Autoflower

After several years of careful selection Dutch Passion are pleased to introduce our special Auto White Widow® Cannabis Seeds. This is the long-awaited automatic version of our best-selling original White Widow. Auto White Widow® is a vigorous and strong auto which gives a powerful high, she was produced from our original White Widow mother plant using the same genetics which have won countless awards and satisfied thousands of growers. Auto White Widow® is very consistent and easy to grow with any grow method. Our automatic version is ready to harvest around 75 days after germination and will yield outdoor 50 to 150g+ of cannabis from a single plant. Experienced indoor auto growers will be able to harvest 200g+ from a single plant, especially when grown in hydro Deep Water Culture systems. Plants reach around 60cm to 1m tall.

The taste is fresh, citrus pine, fairly sweet and strong, and the effect is fast. Auto White Widow® Cannabis Seeds produce bushy and frosty plants with numerous blooms. She produces strong aroma's during growth and dense hard buds.

## White Widow X The Ultimate®

Reg

This superb and long-awaited cross of two of our most respected varieties delivers great yields of very strong, highly resinous, buds. We offer this variety only in regular seeds; she will be popular with new growers, old-school connoisseurs and home-breeders looking for a reliably potent variety which is easy and robust to grow. For many years we have had repeat requests for a White Widow cross, she is one of the original iconic breeds and the strongest indica-dominant in our collection. The Ultimate is perhaps our heaviest yielder, but also very powerful. A male White Widow and female 'Ultimate' were put together to produce this mixed indica/sativa. The high is strong and intense yet allows you to remain active. The plants are very oily with a noticeable Haze taste together with earthy/citrus flavours which are twisted together with pine. She grows up to 1.5m tall with very good yields and does well in all mediums with the best results in DWC (deep water culture). Plants can be harvested as early as 8 weeks but some will prefer to wait 10 weeks for full bud production and ripeness.

## The Ultimate®

Fem

Through careful breeding we have created one of our most important strains, we call it "The Ultimate®" as it combines some of the heaviest yields we have ever seen with genuine connoisseur quality.

It grows to a height of 60-75cm, ideal for the indoor grow room. Flowering time is 8-10 weeks, with explosive bud growth in the last 2 weeks. The Ultimate® (50% indica, 50% sativa) will take plenty of nutrients during the growth cycle and is resistant to moulds and bud rot making it a good greenhouse choice too. The Ultimate® is very suited for taking cuttings.

Our growers have never seen a plant yield as heavily with this level of quality. This is a recession busting strain of epic proportions and is guaranteed not to disappoint. This variety is already setting new standards amongst the Dutch commercial growers and is set to become a Dutch Passion legend.

## Power Plant®

Fem / Reg

As soon as it was released in 1997 Power Plant® became an instant success, a heavy yielding and highly stable classic. Power Plant® is a mostly sativa variety from South Africa and the original version is only available from Dutch Passion. It is a heavy yielder for indoor, greenhouse and outdoor gardens (does well in Mediterranean climates) with bumper yields of 500-600 grams/m2 and is popular with recreational and medical users. It was only ever inbred by us, never hybridised, and remains a pure and stable strain with a great and well deserved reputation. When it was first released every coffeeshop wanted Power Plant® on their menu and it is still found in Dutch coffeeshops today.

Power Plant® is rich in THC and delivers a formidable strong „up“ high with a fresh flavour, smooth/soft smoke and sweet after-taste. The plants reach 1-1.5m tall and the buds are often 30+cm long, with small leaves in them.

# Skunk Family

Consistent, easy to grow and XL yielding premium Skunk genetics

The first Skunk was developed in California in the 1970's by crossing Afghani, Mexican Acapulco Gold and Colombian Gold and brought to Europe in the early 1980's. Skunk varieties are famously easy to grow. Dutch Passion's Skunk varieties are very potent, grow homogeneously and yields are well above average. Skunk varieties are very suited to create mother plants as well as breeding parents for crosses. Dutch Passion have an extensive Skunk gene-bank and decades of experience producing the most potent Skunks varieties for the home grower. Our collection of classic Skunks and hybrids remains as popular as ever with our customers. These varieties grow well in any grow system and are the perfect choice for beginners. Dutch Passion Skunk varieties will deliver a connoisseur quality harvest for the experienced grower.

## The Edge®

Fem

If you're a fan of strong old-school Skunk varieties with bumper harvests then this is a perfect choice. The Edge® is a sativa dominant (75% sativa, 25% indica) variety that delivers heavy harvests of top quality cannabis with a strong Shiva aroma which will remind you of the good old days. THC levels of 17% are typical, this is a powerful variety. The Edge® has a Skunk-appearance, but with slightly more stretch.

The longer inter-nodal distance and multi-branching allows for extra large harvests. This variety prefers extra nutrients during vegetative growth and requires 8-9 weeks for flowering indoors, typically reaching up to 1m tall and yielding up to 500g/m<sup>2</sup>. The Edge® will also perform outdoors in mild climates and will finish as early as mid/late September.

The Edge® delivers a powerful and uplifting high which transitions into a strong stone. This is a robust variety which performs well even for less experienced growers and will tolerate conditions which are not always ideal. Whichever way you grow The Edge® you should get a heavy crop of quality pot.

## Skunk#11®

Fem

Skunk #11 is a true cannabis legend. Quite possibly the worlds most popular weed variety for very good reasons, this is definitely no ordinary skunk.

Many of our customers have been buying Skunk #11 for years and are so satisfied with the yields and the exquisite skunk 'high' that they don't even want to try other varieties! This highly stable premium skunk strain is the result of years of breeding by our top skunk geneticist and is a foolproof variety with excellent growth, yield and potency. Exceptionally resistant to mould and disease, Skunk#11® delivers a famously enjoyable anti-anxiety high that relaxes the body and soothes the soul. The stone is satisfying, high, chilled and erotic. Yet it has enough energy to allow you to function if you need to get things done. In this respect we call it a 'medium stone' which many prefer to an 'all-out' incapacitating stone.

## Euforia®

Fem / Reg

Euforia® is a special strain that came from our Skunk breeding program in 1996. That program gave us a rich Skunk family including the original Skunk #1, Skunk#11, Skunk Passion, Orange Bud, and Euforia®. Euforia® was initially noticed for the high yields of 400-600g/m<sup>2</sup> and being part of the stable Skunk line Euforia® proved to be reliably strong and stable with all the plants looking exceptionally good, one for bumper harvests. Outdoor growers in Holland reported that Euforia® gave excellent quality stash in generous quantities in good summers. Greenhouses really make a great home for Euforia® and she is harvested around the end of October or beginning of November. She is very easy to clone and makes a perfect mother plant to take cuttings from, with the cuttings all developing into healthy uniform plants. Euforia® has been used by many seed breeders due to the stable genetics and easy cloning. Users immediately noted the special euphoric high that was associated with the strain. Medical growers from the 1990's to the current day have told us how good this is for pain relief and particularly for stress relief. A couple of the Dutch Passion staff rate this as their personal favourite and it is one that should be tried by all growers.

## Auto Euforia®

Autoflower

Auto Euforia® combines genetics from our original photoperiod Euforia® with a carefully selected Automatic Skunk. Euforia® herself is an original 1990's photoperiod Skunk selection chosen for the unique euphoric high which many people experience. The anti-stress Euphoric feeling remains the most appreciated quality of both the auto and photoperiod Euforia® genetic lines. This is an automatic sativa with a unique anti anxiety feel-good factor, the fact that she is so easy to grow and yields heavily is a great bonus.

Auto Euforia® is a compact/bushy variety with a skunky taste and sweet aroma. Auto Euforia® is also a productive variety of both buds and resin, yielding well above average and reaching around 1 metre tall. Typically this variety is harvested 10-11 weeks after germination. Auto Euforia® produces top strength cannabis with an energising and happy high, which is at the same time both refreshing and numbing. Auto Euforia® is a great choice if you need a variety which is uncomplicated to grow yet capable of producing top quality harvests. This is a tough and robust variety which is also suitable for less experienced auto growers.

# Orange Family

Citrus taste & aroma with exceptional potency and production.

Orange Bud became a coffee shop bestseller and customer favourite when she was released in the 1980's. Orange Bud has remained one of our all time best-sellers thanks to the blissful sativa high, large yields, famous citrus orange aroma and flavours. Californian Orange is a very strong sativa/indica USA hybrid from the 1980's. Orange Hill Special comes from crossing Orange Bud and Californian Orange and produces a special, long lasting feel-good high. These Orange Family varieties offer a true fruit-of-the-Skunk experience with heavy yields, exceptional strength and great citrus taste. With numerous awards and cup winners you should not miss out on these exclusive and outstanding Orange Family genetics.

## Californian Orange®

Fem

Californian Orange® is a genuine old school classic available only from Dutch Passion. It is a 50% indica / 50% sativa hybrid that dates back to 1980 and since then it has only ever been inbred. The genetics come from an exceptional Californian strain and this variety packs a superb quality stone with a clear 'up' high, very social and very special. If you smoke too much the stone becomes heavier, though the quality is not diminished.

The plants are usually 1.2 - 2m tall and yield well at around 400 grams/m<sup>2</sup> with a normal calyx/leaf ratio. Some of the plants have a pronounced citrus aroma and fragrance making this an appealing, and potent, variety that has satisfied the thousands of growers that have tried it.

The yields are slightly above average but the experience is anything but average. This is a high quality, traditional Californian beauty that dates back to the hippy era. An exceptional strain when it was released and still a sought-after variety today.

## Orange Bud®

Fem / Reg

One of the original Skunk (100% Skunk!) varieties and still one of the best we have ever seen. Orange Bud® was selected from outstanding Skunk genetics in the early 80's, it is a highly potent and very stable strain that grows well indoors or outdoors with any type of grow medium. Even new growers will find Orange Bud® easy and pleasurable to grow, producing generous levels of dense, hard bud covered with crystals and beautiful orange hairs.

As well as being a cup winning variety in the 80's and 90's, Orange Bud® remains a classic skunk that should be savoured by any Skunk connoisseur. Orange Bud® is particularly notable for its yields in 'sea of green' grows. The highly potent smoke is uplifting and cerebral, good for stoners who have active lifestyles. The unique taste is sweet with clear citrus tones of nectarine and ripe orange.

This remains a top-5 best seller for all the right reasons – stable, potent, easy to grow and with great yields, Skunk fans delay no longer, buy some today!

**Fem / Reg**

Orange Hill Special® is an exceptional Orange Skunk selection, a new addition to our 'Orange' family. She was developed with genetics from our much loved Orange Bud® and Californian Orange® varieties, two stable customer favourites which date back to the 1980's. Breeding took place through 6 generations to ensure a stable and strong Orange Skunk with lots of orange hairs at harvest, generous yields and a citrus flavour. This is 50% indica/50% sativa with a 21% THC level which produces a great high with a solid and pleurably relaxing body stone.

Plants typically stay short, around 1 metre, with lots of sticky buds on the side branches. This is the bushiest and best yielding member of our Orange family. Feeding is light initially, but in bloom she can take strong feed and take 8-9 weeks to finish. Outdoors in warm climates she finishes around mid-October (mid April in Southern Hemisphere). Yields are generous and can be up to 450g from a well grown plant. This is highly recommended for fans of the Orange family, and everyone else, a genuinely special variety with great yields. Developed and produced by the breeder who created Power Plant, The Ultimate, Skunk #11, Euforia and Master Kush. Available in feminized or regular seeds

## Passion Fruit®

**Fem**

Through a Dutch Passion friend in Belgium, the Dutch Passion breeders team got their hands on one of the fruitiest strains they've encountered in a long time. This superb clone came from a beautiful Sweet Pink Grapefruit mother and when sampling the end product of this fruity genetic, our test team were blown away by the smell and taste of this strain. You can both smell and taste where this variety got it's name from. The yields of this variety were good, but after our breeders team crossed this individual with an original Orange Bud® clone, yields were increased to the next level and the fruity smell and amazing sweet taste were preserved. The result is something to be proud of and she was announced as "Passion Fruit®" If you are looking for some smokable fruit, then Passion Fruit® is the strain for you!

# Blue Family

Connoisseur quality at its best.

The Blue Family of cannabis genetics were successfully introduced by Dutch Passion in the 1990's. The long lasting, smooth and powerful high, great taste and blue hues on the buds are qualities which are universally appreciated in the cannabis industry. The genetics of "The Blue Family" come from an Oaxacan (legendary Mexican Sativa), a Thai and an indica variety. Through years of selection the specific genetic profile of the different varieties were sharpened and at the same time stabilized. All members of the Blue Family show blue, and red to lilac shades on their calyxes, leaves and stems. The level of colour depends on the temperature at flowering time, colder conditions produce more colour. So, grown outdoors this phenomenon is a lot clearer than when grown indoors. The leaves of the Blue Family strains might show occasional white spots and stripes. This does not slow down growth and is a genetic feature of these strains. In the first three weeks of flowering the Blue Family varieties grow slower compared to other strains. After the third week of flowering they will catch up and give a beautiful harvest. The Blue Family varieties have always represented a special level of connoisseur quality for the cannabis home grower.

## Blueberry®

Fem / Reg

Dutch Passion Blueberry® is the original, a famously classy and enjoyable cannabis combined with fruity flavours and blue colourations in the leaves and buds. The genetics are 80% indica / 20% sativa and date back to the 1970's. Repeat growers of Blueberry® often like to germinate a number of seeds to find a special mother plant, she is easy to take cuttings from and you will never get tired of top quality Blueberry® bud. Although she yields well under ideal conditions she is grown primarily by those growers looking for that special, relaxing and refined Blueberry® high.

She may not be the easiest variety for the newer grower, and can be a fussy feeder, but she will repay the experienced grower with harvests of perhaps one of the best cannabis varieties available. Still a coffeshop favourite decades after she was introduced.

Blueberry®

## Blue Auto Mazar®

Autoflower

Blue Auto Mazar® Cannabis Seeds combine the best of two of Dutch Passions legendary original automatics into an outstanding new potent hybrid. It is a cross of Auto Blueberry® and Auto Mazar®, two of our most loved and best selling cannabis seed varieties. The connoisseur-quality Auto Blueberry parentage benefits from the potency and heavy yields of the Auto Mazar genetics, this is one of the best automatics available today and one which we believe will be very hard to surpass. Blue Auto Mazar® is ready to harvest around 75 days after germination and is 75% indica and 25% sativa. This variety will produce cannabis plants which are a blend of both parent genetics, but you will also see some Auto Blueberry-leaning plants, and some which closely resemble the original Auto Mazar. In bloom she rewards the grower with a complicated array of fruit aromas and occasional scents of spice; pepper, earthy.

The effect is strong, happy and sedating on the body. A comfortable and very enjoyable high complements a variety with great yields and numerous blooms which are heavy with bud and resin production.

## Auto Blueberry®

Autoflower

Auto Blueberry® has quickly become the connoisseur choice of autoflower. It combines authentic Blueberry aroma and flavour thanks to a careful breeding program which crossed a very special Blueberry female with an indica dominant auto. Selective back-crossing until the F4 generation gave a fully automatic Blueberry, the F4 was self-pollinated to create the F5 seeds which have become a must-grow variety for anyone looking for a luxurious genuine Blueberry experience in a fast autoflower form.

Most plants have the famous Blueberry flavours and colours; she will yield very well with dense solid buds that are soaked with resin and are very potent. Auto Blueberry® gives a smooth, hugely enjoyable yet powerful Indica effect which lasts several hours. Everyone should try growing this variety at least once!

## Auto Blackberry Kush®

Autoflower

Auto Blackberry Kush® is an automatic cross between Dutch Passion original Blueberry and a dark coloured resinous Kush hash-plant selected from our gene bank. Auto Blackberry Kush® has been introduced to offer a top quality indica with a heavy hitting stone together with a fresh fruity Kush taste. The Blueberry may slightly, but not always, dominate the Kush characteristics giving a sweeter and fruity influence together with the strong earthy indica contribution from the Kush. Auto Blackberry Kush® grows vigorously with a strong main bloom and numerous side branches typical of an indica autoflower. The majority of plants will show colour in the leaves/buds at harvest, occasionally the hard and compact buds may develop particularly dark colours.

Auto Blackberry Kush® typically reaches around 0.75 - 1 metre and is ready to harvest about 10 weeks after germination when grown on a 20/4 light cycle. A superb new auto which has it all, highly recommended.

# Afghani Kush

Dense sticky buds and a powerful body stone.

Dutch Passion Afghan landrace genetics were obtained decades ago in the Mazar i Sharif region of Afghanistan in the 1980's, when the area was still accessible to tourists. Today's Dutch Passion collection of Afghani Kush varieties include our famous Mazar, Master Kush and Night Queen varieties. Afghani Kush varieties are easy to grow. Typical characteristics of Afghani varieties are dense compact buds and a christmas tree shape. The plants may not grow very tall but they are highly productive with plenty of extremely resinous blooms. The effect of Afghani Kush is strong, powerful and intensely stoned. Top quality indica genetics do not get much better than these.

## Night Queen®

Fem

Night Queen® is a pure and unhybridised Afghani indica first seen in the 1980's and now making a re-appearance in the Dutch Passion collection. She grows in a compact and bushy form and produces long and dense blooms of very heavy hitting indica bud. The harvest is special old-school Afghani weed, sticky resin coats the blooms with citrus flavours and spicy scents.

This is very strong, just a small joint was enough for some of our test team. Night Queen® can be used sparingly yet still be very effective so your harvest will go a long way. Users report a powerful body stone, a really potent indica-style buzz. The effect is very pleasant and relaxing, some users report it helps them sleep. A real treat for those looking for a good old-fashioned heavy hitting variety that is easy to grow and not at all demanding in the grow room.

## Auto Night Queen®

Autoflower

Auto Night Queen® was created from our original Afghani Night Queen®, a highly resinous variety. It's one of our strongest indicas ever with THC levels of over 20% and she won 1st Prize at the 2015 Champions Cup in Malaga. Auto Night Queen® continues the family tradition of premium strength sticky kush harvests which are well above average in quality and quantity. Indoors Auto Night Queen® can yield up to 500g/m2 and outdoors in good conditions yields of 150g per plant are not unusual. Auto Night Queen® is one of the most potent autoflowers we have seen, delivering an unusually heavy and long-lasting effect which is popular with medical and recreational users.

To create Auto Night Queen® we crossed a specially selected clone from the original photoperiod Night Queen® and crossed her with a dark autoflowering Afghan Mazar-i-Sharif hybrid from our gene bank. The result is rich, smooth and sweet tasting. Powerfully soothing on mind, body and soul. The rich hash scents of this Afghan Kush fill the air, she is delicious whether you smoke or vaporize her. Plants typically reach around 1m tall. Auto Night Queen® will appeal to home growers looking for maximum potency.

## Master Kush

**Fem**

We bravely extracted this sturdy plant back from the Hindu Kush region of Afghanistan, it is a compact and forgiving variety that grows well in any medium such as soil, hydro, coco etc. Master Kush produces an extremely potent smoke that is smooth and sweet with earthy/citrus flavours, the high is strong and powerful. Less odour than normal is produced during flowering (important for some growers).

Buds are large, heavy and pale green with long hairs that range from white to orange/brown. Master Kush can be susceptible to mould in humid conditions due to the sheer size and density of the bud growth.

Master Kush thrives under most growing conditions; it clones easily and is a reliably generous producer of very high quality pot. A favourite of ours, we highly recommend it to you.

## Jorge's Diamonds #1®

**Fem**

We are pleased to work together with Jorge Cervantes in our mutual project: "Jorge's Diamonds". The many growbooks, DVD's and articles Jorge Cervantes published in the past 25 years in 9 languages, have helped growers worldwide to cultivate some of the best marijuana in the world. Now growers can grow Jorge's Diamonds #1 and take full advantage of the fruits of Jorge's collaboration with his old friends at Dutch Passion Seeds. The genetics of the strain were selected by Jorge from the 25 year old "Research Gene Pool" of Dutch Passion.

Jorge's Diamond is a unique resin-packed indica-dominant strain that is potent, sweet, flavorful and incredibly smooth smoking. The rare indica-dominant genes are mixed with just the right amount of sativa to give the smoke a very strong soaring long-lasting high. The exceptional taste and aroma are fruity and sweet. The insatiable taste is sweet and similar to wild honey smothered in raspberries. The strain is almost maintenance free. Medical note: By Thin Layer Chromatography the THC percentage was calculated at 16 to 18%, while the strain (medical note) is high in THCV, CBD and CBN.

## Brainstorm

**Fem**

The genetics of Brainstorm were introduced in our seed collection in 1996. The strain has been updated for the second time in 2006 by selecting a premium clone from the original seed stock. Through this premium clone the "Brainstorm" feminized seedline is produced. Brainstorm is a sturdy plant with the power and yield of the famous Northern Lights #5, hybridized with potent 100% Haze genetics. Brainstorm has a solid, strong long lasting "high", combined with a well balanced, soft smoking experience. Good for bumper harvests. A perfect variety to select clones from.

## Mazar®

**Fem / Reg**

Mazar® is one of the strongest and best varieties ever created by Dutch Passion. Our original Mazar® is a 1980's classic made from a special Skunk#1 crossed with a prized Afghani, the genetics were upgraded in 1997 and Mazar® remains one of our best selling varieties of all time. Mazar® has a Christmas-tree appearance, the heavy side branches ensure large harvests. The growth vigour and toughness make Mazar® a good choice for less experienced growers. Mazar® is a real Afghani hash plant with extremely heavy resin production and great potency. She may need supporting at the end of flowering and produces notably strong odours.

Mazar® was one of the first Dutch Passion varieties available in feminized seeds, since then she has been used by other seed banks in the creation of new varieties. The buds are sticky, highly aromatic, sweet and earthy with a taste of good Afghani hash and hints of pine/citrus. The strong effect is very physical, powerful yet relaxing. A happy, cozy and numb combination with a contemplative and meditative mental quality.

## Auto Mazar®

**Autoflower**

Auto Mazar® is a high performance autoflower, she is robust and easy to grow. She is also a reliable producer of great quality cannabis whether grown in soil, coco fibre or a hydro system. Auto Mazar® delivers a genuinely strong and long lasting high. This is one of the most consistent autoflowers ever created and remains Dutch Passion's best selling autoflower for all the right reasons.

Original Mazar is a legendary prize-winning variety which needs no introduction; we crossed this with an indica-dominant auto to create Auto Mazar®. The plants typically reach 70-80cm, they grow strongly and yield extremely well. New growers often crop 50g+ of sticky potent bud per plant. Experienced growers routinely crop 100-200g+ per plant especially in hydro systems. The best result so far is 900g.

# USA Special

Premium quality resin-dripping USA genetics.

USA genetics have made a major contribution to the cannabis gene pool and Dutch Passion are pleased to bring you some of the very best quality seed varieties. Recent cannabis legalization in Colorado and other states has allowed some genuinely special strong, sweet and sticky cannabis varieties to emerge. Our USA seed varieties offer bigger yields than you may be used to and top strength cannabis that you will want to grow again and again. The varieties, especially the autos, are easy enough for first time growers yet offer extreme growth potential to appeal to experienced home growers. Seriously strong.

## Auto Daiquiri Lime®

Autoflower

Auto Daiquiri Lime® is based on a unique Californian Orange phenotype with a sharp citrus lime taste which was hybridised with an elite resinous photoperiod USA Sour Diesel cutting. This was made into a feminized automatic variety Auto Daiquiri Lime® which combines the normal superb Dutch Passion auto potency with an unusually rich and appealing fruity/diesel aroma and a fresh sour taste. She is ready to harvest 11 weeks after germination and prefers a light nutrient regime. This variety suits growers looking for hard hitting USA style XXL harvests with rapid growth. Big, fast and easy, easy enough for a first time grower. Top quality original USA genetics with a fruity sour taste and a strong high.

## Auto Brooklyn Sunrise®

Autoflower

Auto Brooklyn Sunrise® combines a distinctively spicy taste with large yields of frosty top strength cannabis. The genetics come from the acclaimed USA East Coast 'Brooklyn' Diesel clone noted for a famously rich diesel aroma and strong high. This was combined with some connoisseur AK genetics from upper New York State and made into a feminized autoflowering variety. The result brings together the best East Coast genetics into a heavy yielding and great tasting new auto with a strong yet smooth high. Auto Brooklyn Sunrise® gives an unusually strong initial euphoric high, it's a perfect morning/breakfast choice which is where the variety got its name. This Big-Apple auto is at home in any urban grow-room and comes with our highest recommendations.

## Auto Colorado Cookies®

Autoflower

Coming from Colorado with some of the strongest indica-dominant auto genetics we have found so far. This is a USA autoflowering variety combining a delicious fruity flavour with typical Dutch Passion extreme potency and yields which are significantly above average. The genetics came from our original best-selling Auto Blueberry and an exceptional Girl Scout Cookie cutting from Colorado, famed for a heavy indica stone with a sweet tropical mango taste. The hybridisation retains a strong fruity aroma as well as the intense feel-good high from the Girl Scout Cookies. The freedom to grow legally without restrictions in Colorado has enabled some truly excellent genetics to emerge with incredible taste, aroma and potency. This variety will suit indica fans looking for potent USA genetics with fruity flavours and very relaxed after-effects.

NEW!

## Glueberry O.G.®

Fem

As the green revolution is steadily growing bigger in the USA, also USA based genetics are flourishing. A good example of potent USA genetics is Gorilla Glue. This strain was the successful result of crossing Chem's Sister with Sour Dubb and Chocolate Diesel. These parents ensured the connoisseur taste and high of this amazing strain.

Another great USA variety that probably most growers have sampled by now is one of the many variations of OG Kush. With its distinctive taste and mysterious heritage, it has already filled many grow rooms with extremely potent product.

The master growers of Dutch Passion have crossed these two magnificent strains with each other and crossed the result with our longtime classic Blueberry. The outcome of this beautiful cross with XL yields and an average height of 1.5/2 m is called Glueberry OG and we are proud to have a new addition to our USA Special line.

## Auto Glueberry O.G.®

Autoflower

Auto Glueberry OG® is the autoflowering version of the hard hitting, resin dripping photoperiod Glueberry OG. To turn Glueberry OG into an autoflower, we crossed (Gorilla Glue x OG) with the original Auto Blueberry to ensure the same taste and effect as her photoperiod sister.

If you're looking for a sativa dominant, potent hybrid that can well be used in both SOG and SCROG grows, than try out this American delicacy.

With subtle Diesel hints and fruity Blueberry tones, Auto Glueberry OG® can be considered a sweet tasting strain with both Asian and American roots.

This sativa dominant autoflowering hybrid with extra large yields will please any grower both indoors and outdoors (in sunny climates) and ensures a great harvest to enjoy with family and friends.

# Latin America

Prize winning new world genetics.

The cannabis scene in Latin America has never been as active as it is today. Uruguay became the first country to legalize cannabis and many South American nations are hoping to follow. Chile's cannabis laws are also becoming more liberal and the future looks promising for South American cannabis breeding. Dutch Passion are pleased to offer the multiple prize winning Desfrán®, a jungle sativa based on the famous 'Destroyer' genetics. Desfrán® is a very stretchy pure sativa with an energetic soaring 'up' high. We will continue to monitor South American genetics and bring the very best ones to your grow room.

## Strawberry Cough®

Fem

The "Strawberry Cough®" genetics are of North American origin and partly uniquely European. "Strawberry Cough®" is a hybrid between an indica and a sativa. From this hybrid we made a selection having about 80% sativa influences. We have used this selection for the production of our "Strawberry Cough®" Seeds. Our "Production and Research Team" has succeeded in creating the fruitiest variety imaginable. The fresh strawberry taste and aroma are very evident and wonderful to experience. Strawberry has an "up high" effect of medium THC-strength. The plants are beautiful to look at. The total flowering time takes about 9 weeks. The first and most powerful growth spurt of flowers ends in week four, the second at week 9. "Strawberry Cough®" is easy to grow and does not need a strong fertilizing scheme. Standard fertilizing will do for good results. Individual plants will grow to medium height. Are you ready for the "Strawberry Experience"?

## Desfrán®

Fem

Desfrán® is a legendary variety in South America and a multiple prize winner of many cannabis cups. Desfrán® is the result of crossing Destroyer with Destroyer, she was originally a 3-way crossing of Mexican Oaxaca, Colombian Punto Rojo and Meao Thai and comes to Dutch Passion thanks to Alberto from Argentina.

During flower she stretches and can triple her height. Desfrán® is very resinous variety suited for SOG and SCROG grow methods and usually takes 9-12 weeks to flower. Desfrán® has a fruity aroma like pear and green apples, the taste is like enjoying a pear caramel with hints of grape and melon. Desfrán® produces unusually dense and compact flowers for a Sativa. When dried, the flowers look like glazed pinecones. Early harvest can result in a very cerebral and psychedelic high, if you harvest Desfrán® late she tastes sweeter and is a true destroyer. Desfrán® is one of the best varieties Alberto has ever seen, we hope you will think the same.
