# *Indoor*

These Female Seeds varieties are not only tasty but also a pleasure for your mind. Most of them are very high and energetic so you will not only get wonderful and great ideas, but also enough energy to do something and make full use of your creativity. Enjoy!

Here you find our current tasty indoor selection.

## **Blueberry Cheesecake**

**Height:** 80 - 100 cm  
**Flowering time:** 7-8 weeks  
**Seed to harvest:** 10 - 11 weeks  
**Harvest:** high quality, high yield harvest  
**Taste/Smell:** Extremely strong, pungent creosote aroma followed by an unusual cheesecake smell.  
**Effect:** Powerful stoned, whilst the body is in balance and relaxed.

Our Blueberry Cheesecake (Cheese x Blueberry multiple hybrid) is selected from an extremely strong, smelly mother (you will be able to smell it straight through the bag!). This cannabis strain has been stabilized on this special phenotype that has a really amazing Blueberry Cheesecake smell.

The plants are very resinous, giving healthy vigorous plants with a light blue shine. They can triple in volume and / or height after being put on 12/12.

Perfect for outdoor in Mediterranean climates.

## **BubbleGummer**

**Height:** 60 - 80 cm  
**Flowering time:** 8 weeks  
**Seed to Harvest:** 11 weeks  
**Harvest:** medium  
**Taste/Smell:** sweet and fruity bubblegum odor and taste.  
**Effect:** Euphoric, smooth and soft, perfect for getting things done during the day.

The BubbleGum cannabis was originally developed by growers in Indiana, USA. From there the genetics moved to New England and eventually Holland.

It has taken many generations to finally produce this stable BubbleGummer with the characteristic sweet smell (truly resembling a typical bubble gum taste) and euphoric high, the original trademarks of this famous cannabis strain.

Usually not too branchy, it produces a good, compact, candle bud covered with crystals. Easy to grow, it is perfect as a beginner strain.

## Lemon Kush

**Height:** 80 cm - 100 cm

**Flowering time:** 8 - 9 weeks

**Seed to harvest:** 9 - 10 weeks

**Harvest:** high

**Taste/Smell:** A unique weed with strong / husky lemon smell and taste.

**Effect:** Stony, yet high all-round buzz, warm feeling, good to relax.

A chitral kush from the Hindu Kush mountain range in Afghanistan and Pakistan.

She is mostly indica with a

little stretch towards the end. She produces very white, hard and highly resinous nuggets. Although despite this indica heritage, she leads to a sativa kind of high in the head, and is therefore a cannabis favourite amongst the connoisseurs of the medical community in Holland.

Also suitable for outdoors in temperate or Mediterranean climates (where citrus grow), where recent reports have shown 1kg excellent quality bud per plant! Harvest at the end of September.

## Pure Ak

**Height:** 50 - 70 cm

**Flowering time:** 7 weeks  
Seed to harvest: 9 weeks

**Harvest:** high

**Taste/Smell:** Soft, and exceptionally penetrating aroma.

**Effect:** Like a skunk, it comes up strong and fast, and keeps you there for a while.

Our Pure AK has increased its popularity as one of the strongest early finishing strains available anywhere.

Pure AK produces hard

buds with an exceptional penetrating aroma. Pure AK is an indica/sativa hybrid, yet it retains most of its sativa qualities in its high. An occasional leaf mutation can occur, but this is familiar with this strain. Not good for outdoors where the very dense buds would easily get mould.

## Skunk Special

**Height:** 70 - 90 cm  
**Flowering time:** 7 - 8 weeks  
**Seed to Harvest:** 10 weeks  
**Harvest:** Large, high quality  
**Taste/Smell:** Citric, old school skunk piss smell  
**Effect:** Head high and body stone. Good balance between Indica and Sativa.

From all the Skunk-varieties, we selected the fastest producer of enormous buds

with a strong skunk aroma and a heavy buzz. Skunk special is a stable strain with little variety between the individuals. These will give you an enormous quantity of great weed. The buds are red and hard as stone. All this make people say there is no better skunk, or that it is an Elite skunk. (THC 15 - 20 %)

Skunk Special is ideal for indoor artificial light, yet it is also perfect for outdoor growing or greenhouse as it does very well in temperate climates.

## White Widow x Big Bud

**Height:** 60 - 80 cm  
**Flowering time:** 7 weeks  
**Seed to harvest:** 9 weeks  
**Harvest:** enormous  
**Taste/Smell:** Skunky orange taste and smell  
**Effect:** White Widow 'knock-out' Stone.

Originally a strain from our X-line in 2010, this very popular cannabis variety then moved to our permanent catalogue due to its popularity.

It is a dihybrid, which means that from the same F1 cross, two populations were selected and stabilised separately for 6-7 generations. This process was made on two criterias: one population for its high yield and big buds, the other one for its white widow effect. The two resulting plants originally from the same genetics were then crossed again. You can expect enormous dripping from the very resinous buds, reason why it is not recommended for outdoors.

## ICE

**Height:** 60 - 80 cm  
**Flowering time:** 8 - 9 weeks  
**Seed to harvest:** 10 - 11 weeks  
**Harvest:** very high  
**Taste/Smell:** Strong diesel smell and taste, very medicinal.  
**Effects:** very fast, hard indica hit.

The ICE ® cannabis is a selected phenotype out of a Skunk Special X White Widow cross. She was selected out of 500 females, because

she had the best of both sides. Years of backcrossing and cubing have been spent to stabilise this cross towards the first phenotype. Even a little bit of Blueberry was crossed in and stabilised again. You will find the enormous buds of the Skunk Special, the trichomes coverage and power of the White Widow, with an Indica look. The highest THC-levels were measured in the ICE during the High times Cup of 1998. (THC: 15 - 20 %)

A very heat resistant cannabis strain. Although an indoor cannabis strain, she grows perfectly outdoor in Mediterranean climates.

## Iced Grapefruit

**Height:** 100 - 120 cm  
**Flowering time:** 8 weeks  
**Seed to harvest:** 11 - 12 weeks  
**Harvest:** high  
**Taste/Smell:** Strong sweet smell and black hashish taste, very medicinal cannabis  
**Effects:** relieves pain and feelings.

This is a most interesting cross between the Grapefruit and ICE, making it the perfect mental painkiller.

Where pharmaceutical antidepressants numb feelings, our Grapefruit cannabis makes people feel happy and enlightened, just like the good old Sativa. Then the ICE, being one of the strongest cannabis varieties of the world, is more of a physical heavy bodied painkiller. These medical aspects of both cannabis varieties should give this cross some excellent prospects .

(CBD: 5 % THC: 20 %)

Expect long big buds with a height around 1.20m. The smell will be very special with the fruitiness of the Grapefruit combined with the black hash ozone of the ICE.

## C99

**Height:** 80 - 100 cm

**Flowering time:** 8 - 9 weeks

**Seed to Harvest:** 10 - 11 weeks

**Harvest:** high

**Taste/Smell:** extremely fruity, like a pineapple/grapefruit

**Effect:** feeling warm, happy, very high and creative but with still enough energy to do something.

The C'99 is the holy grail of the cannabis strains, as she resembles the high and taste of an exceptionally sweet landrace sativa. This one takes normally half a year to flower, but the C99 flowers in 7 - 8 weeks. On top of that the buds are quite sugared.

This new batch is a cross of two exceptional basic phenotypes, the Grapefruit and the Pineapple. Both derived from the original Brothers Grimm C99. It is ready to flower in 4 weeks from seed, which is much faster than the original C99 (6 - 8 weeks).

One not to miss!

It grows well outdoor, especially in temperate or warmer climates. We even got a little harvest in March from seeds sown in December by the kitchen window! (CBD: 1 - 5 % THC: 20 %)

## Grapefruit

**Height:** 80 - 100 cm  
**Flowering time:** 8 weeks  
**Seed to Harvest:** 10 weeks  
**Harvest:** high  
**Taste/Smell:** extremely fruity pineapple/grapefruit aroma.

For those who like it sweet! Developed out of a Cindy 99 cannabis, then bred with a fast flowering Sativa for some generations, it has been selected on its strong Grapefruit/Pineapple smell. This generation is select-

ed on shorter phenotypes. She is a super-fast flowering cannabis strain, which will EVEN flower under 24 hours in low light conditions. This new style sativa is early maturing, fast flowering and maximum yielding. Stabilised on early maturity for some generations now. A highly praised cannabis strain and very popular for years, it is recognised for its pleasurable happy high, just like the old school sativa landraces. Only the flowering period of the Grapefruit is 8 weeks instead of half a year. It goes very well outdoor where citrus grow. A true winner!

## Sex Bud

**Height:** 80 - 100 cm  
**Flowering time:** 8 weeks  
**Seed to Harvest:** 10 weeks  
**Harvest:** high  
**Taste/Smell:** extremely fruity pineapple/grapefruit aroma.

This new enhanced strain of a fruity white sativa is great for losing inhibitions, maintaining a high energy level and getting creative with a willing partner! The effect works best when used in moderation and can bring

the sexual experiences to new heights. Men and women will both feel new levels of juiciness and sensuality. It is a great strain it will allow long philosophical conversations, without losing track. She can be grown everywhere outdoors: on a balcony, a garden or field; and almost anywhere not too cold, since this cannabis strain flowers early, without waiting for the shorter days. On top of that the buds are quite sugared; it matures in 4 weeks from seed.

# *Outdoor*

Female Seeds has been renowned for its outdoor strains since the 1990's. These varieties have been developed for the temperate/mountain climate with early flowering capabilities, a high mold resistance, are 7 all semi- automatics and have a high flower to leaf ratio (not too leafy). The best sowing time is mid April to mid May.

Here you find our current outdoor selection.

### *Easy Sativa:*

**Height:** 150 - 250 cm  
**Flowering time:** 7 weeks  
**Harvest time:** September in Northern Europe  
**Harvest:** very high  
**Taste/Smell:** herbal taste and aroma  
**Effect:** clear sativa high.

A cannabis strain so easy outdoors!

It is all in the name: an easy new-style sativa cannabis variety for inside the greenhouse and outdoors. Very stable and reliable, it is one of the best outdoor bud producers in Holland!

Most of them flower under 18 hours light and start flowering half July and reward you with a gigantic amount of large buds in September. There is some variation in bud shape and taste (between spicy and sweet), but all a clear sativa high. Well worth a try!

If you like a few big plants, it is also perfect for indoors, partly because it is very mould resistant.

### *Red Purps:*

**Height:** 150 - 200 cm  
**Flowering time:** 7 weeks  
**Harvest time:** half till end September in the Netherlands, End of August in Med  
**Yield:** high  
**Taste/Smell:** liquorice candy taste and odour  
**Effect:** sativa effects, good head high.

Taste wise it is the perfect substitute for the Purple Power cannabis seeds (Haze x Skunk). Red Purps performs almost the same as the Purple Power in growth, although experience shows that the taste and smoke properties are far superior. Like the Purple Power, the bud colour is red to purple, she is very early flowering (first flowerers appear at the beginning of July) and will finish at the beginning/half September.

Growth is a bit more indica-ish, however the smoke is sativa-ish: candy liquorice with the Purple undertone.

Also very good indoor, recommended for beginners, easy to grow anywhere.

### **Purple Maroc:**

**Flowering time:** 7 weeks  
**Height:** 150 - 200 cm  
**Harvest time:** half till end September in the Netherlands

A cross of Purple Power cannabis with a big fat tasty Moroccan mother. While the mother has been selected on weight and taste, she adds power and resin production to the Purple Power. Both cannabis strains are super early and the fastest varieties avail-

able for outdoor in cold/mountain climates, very mould resistant. This with the great taste of the Maroc it's an absolute winner. Some buds will be light purple overloaded with resin. A true eye-candy!

The best sowing time is mid April to mid May. We wouldn't recommend pre-growing them indoors, because they are semi-auto-flowering and this would cause them to start flowering in May outdoors. They need the longer days and intensive midsummer sun to keep them in growth. For the warmer/Mediterranean climates we offer outdoor strains with a very high flower to leaf ratio (more flowers than leaves, rock hard buds).

### **Maroc:**

**Flowering time:** 7 weeks  
**Height:** 100 - 150 cm  
**Harvest time:** half July till end September in the Netherlands  
**Harvest:** high  
**Taste/Smell:** irresistible flowery aroma and ketama taste.  
**Effect:** body stone, with a broader effect than hash, thanks to the cannabinoids combination.

This pure cannabis strain is very underestimated! It has its ancestors in the Ketama region and was subject to an intense breeding program, which resulted in a very resinous outdoorstrain. Buds smell like Ketama, are long and slender with an open structure. Unfortunately it needs the Moroccan climate and soiltype to get the pure Ketama taste. But instead of this pure Ketama taste, the European version develops an enormous aromatic smell so special that you can't resist the smell of it – not to mention the smoke!

The best sowing time is mid April to mid May. Be aware thaac it is a semiautoflowering variety as the Purple Maroc. They need the longer days and intensive midsummer sun to keep them in growth. For the warmer/Mediterranean climates we offer outdoor strains with a very high flower to leaf ratio. (more flowers than leaves, rock hard buds).

# *Automatic Flowering Strains:*

## GENERAL ADVICE:

**Timing Indoor:** for the quickest result we recommend to use a 12/12 schedule from the beginning. 6/18 will produce a bigger harvest but generally takes longer.

**Timing Outdoor:** may take longer, according to different variables:

- The day length
- The strength of the sun vs shades
- Increase of day length (up to June) = more leaves  
Decrease of day length (after June) = more budproduction)
- In the city/country/mountain: the different sunlight times, shades, quality of water

### *Auto AK:*

**Height:** 40 - 80 cm  
**Flowering time:** 8 weeks  
**Seed to Harvest:** 10 weeks  
**Harvest:** high (for an automatic)  
**Taste/Smell:** Strong, AK  
**Effect:** Like an AK, full spectrum stone.

This is an automatic cannabis version of the AK47. Created by crossing the AK cannabis with the Lowryder, stabilising it while maintaining the original AK47 characteristics. AK produces

hard buds with an exceptional penetrating aroma. AK cannabis is an indica/sativa hybrid yet it retains most of its sativa qualities in its high. An occasional leaf mutation can occur, but this is familiar with this strain.

### *Auto Bubble:*

**Height:** 40 - 60 cm  
**Flowering time:** 8 weeks  
**Seed to Harvest:** 10 weeks  
**Harvest:** high (for an automatic)  
**Taste/Smell:** strong and sweet smell  
**Effect:** relaxing, not too strong.

An autoflowering cannabis version of the Bubble Gum. Originally the Bubble Gum was developed by growers in Indiana, USA. From there the genetics moved to New England and eventually Holland. This cannabis

grows vigorously and finishes flowering in about 8 weeks. Highly resinous and extra sweet. Certain individuals actually display that distinct pink chewing gum scent and flavour.

### *Auto Kush:*

**Height:** 100 - 120 cm

**Flowering time:** 8 weeks

**Seed to Harvest:** 10 weeks

**Harvest:** High (for an automatic)

**Taste/Smell:** strong indica smell

**Effect:** stone like a Kush!  
More narcotic than Lemon Kush.

An automatic version of the cannabis strain named after the Hindu Kush mountains. Kush cannabis plants come from Afghanistan, Iran, Pakistan and Northern India.

The aroma is reminiscent of a musky haze smell. Potent autoflowering strain, it makes long sticky buds with many offshoots, but less compact as the original Kush.

### *Auto Speed Bud:*

**Height:** 40 - 80 cm

**Flowering time:** 5 weeks

**Seed to harvest:** 8 - 10 weeks

**Harvest:** medium, fast

**Taste/Smell:** Soft taste with a diesel undertone

**Effect:** whole daytime smoker, not too strong.

A selected strain on speed and resinous buds out of all the automatic strains on the market today.

Low leaf production, with more flowers than leaves.

The second photo is at 5 weeks from seed. Perfect for beginners or lazy growers, since it will flower on any balcony and produce a good cannabis as long as it is not too cold. The harvest will depend of the amount of light received.

## *Auto White Widow x Big Bud*

**Height:** 80 - 90 cm

**Flowering time:** 8 weeks

**Seed to Harvest:** 10 weeks

**Harvest:** very high

**Taste/Smell:** Fruity skunky aroma & smell.

Time has finally come to have an automatic flowering version of our world best seller White Widow x Big Bud.

These plants are vigorous and produce enormous buds which start off with an open structure and then fill out completely from bottom to top.

A fruity, skunky aroma with a relaxant effect and full of flavour. The flowering time for these plants is pretty fast, approximately 70-80 days whether grown indoors or outdoors.

### *Auto NL:*

**Height:** 40 - 80 cm  
**Flowering time:** 9 weeks  
**Seed to Harvest:** 11 - 12 weeks  
**Harvest:** high (for an automatic)  
**Taste/Smell:** strong Northern Light odour  
**Effect:** fast, deep indica hit.

This cannabis strain has been undergoing constant changes for 20 years now; higher flower rate, sugared buds, fewer and thinner leaves resulted in higher yields in a S.O.G. But it is

still the same strong cannabis product, with the original Northern Lights smell and taste. In this case in the autoflowering cannabis version. Very potent, it can be grown perfectly in the most northern places, like Scandinavia, Poland, Siberia. In this regions of the world it also grows very well in the gardens.

### *Auto Haze:*

**Height:** 80 - 100 cm  
**Flowering time:** 8 weeks  
**Seed to Harvest:** 11 - 12 weeks  
**Harvest:** high  
**Taste/Smell:** strong and sweet haze smell and taste.  
**Effect:** what you can expect from a Haze strain: an energetic, yet calm sativa high.

As most autoflowering cannabis seeds out there are more influenced by indica genetics instead of sativa, we could not wait to try this Auto Haze. The cannabis Haze is a variety which has never been easy to grow, but with this autoflowering haze times are changing. Even die-hard Haze fanatics are very enthusiastic about this cannabis variety. Very good for growers who don't have a lot of space and time, and still want to get a nice, easy to grow sativa weed.

## *Female Seeds strains advices for outdoor growing*

### **INDOOR, OUTDOOR AND AUTOFLOWERING:**

- Indoor cannabis strains were developed and selected to be grown with artificial grow lights. Cannabis plants originate mostly from warm and wet climates, which means that most of indoor strains will grow very well outdoor in mediterranean-like and warmer climates.
- Because these were bred away from the natural conditions (rain, pests, mould...) they might not resist very well outside, especially mould sensitive strains or varieties with big and heavy buds. This is where Outdoor strains come into place: they are often early flowering and resistant to mould, which is perfect for most outdoor culture.
- In the regions with cold weather (under 15°C / 59F) in October, you will prefer to use Automatic Flowering strains. Otherwise, your photo-period sensitive plants will start flowering too late and will not have enough time to mature completely before the weather gets too cold. Automatic Flowering strains are also very useful for beginner growers or when you want to harvest during summer.

### **TIPS FOR CHOOSING YOUR STRAIN:**

- **Outdoor strains not recommended for indoor:**  
Maroc, Purple Maroc
- **Outdoor strains also good for indoor growing:**  
Red Purps, Easy Sativa

### **• Good indoor strains for outdoor:**

- Mediterranean climates: All except Pure AK, WWxBB.
- Tempered: All except the above, Lemon Kush, ICE.
- Grapefruit, Iced Grapefruit, C99 and Sex Bud (formerly White Grapefruit): all our new style Sativa strains grow really good outdoor, thanks to their shorter maturation time and semi-automatic flowering feature.
- Skunk Special was bred in Dutch Greenhouses, excellent outdoor strain.

### **• Things you want to take into account when choosing your seeds for outdoor growing:**

- Greenhouse = warmer, less wind, protects from rain on the buds
- City = very big cities are often warmer, but sometimes have a poor water quality (balcony grow)
- Behind the window (less light) / Greenhouse / Balcony (pot) / Garden / Field

**Disclaimer:** All informations within this brochure is for educational purposes and is not intended to condone or promote or incite the use of illegal or controlled substances.
